henry harris here provides an account of how scientists came to understand that the bodies of
all living things are composed of microscopic units that we now call cells harris turns to the
primary literature the original texts scientific papers and correspondence of medical researchers
involved in the formulation of the cell doctrine to reconstruct the events that enabled

researchers to comprehend the nature and purpose of cells translating many of these documents into english for the first time harris uncovers a version of events quite different from that described in conventional science textbooks focusing on the scientific history of the genesis of the cell doctrine the author also considers contemporary social and political contexts and shows how these influenced what experiments were undertaken and how the results were represented

the cell is the basic building block of life in its 3 5 billion years on the planet it has proven to be a powerhouse spreading life first throughout the seas then across land developing the rich and complex diversity of life that populates the planet today with the cell a visual tour of the building block of life jack challoner treats readers to a visually stunning tour of these remarkable molecular machines most of the living things we re familiar with the plants in our gardens the animals we eat are composed of billions or trillions of cells most multicellular organisms consist of many different types of cells each highly specialized to play a particular role from building bones or producing the pigment in flower petals to fighting disease or sensing environmental cues but the great majority of living things on our planet exist as single cell these cellular singletons are every bit as successful and diverse as multicellular organisms and our very existence relies on them the book is an authoritative yet accessible account of what goes on inside every living cell from building proteins and producing energy to making identical copies of themselves and the importance of these chemical reactions both on the familiar everyday scale and on the global scale along the way challoner sheds light on many of the most intriguing questions guiding current scientific research what special properties make stem cells so promising in the treatment of injury and disease how and when did single celled organisms first come together to form multicellular ones and how might scientists soon be prepared to build on the basic principles of cell biology to build similar living cells from scratch

this volume examines the origin of eukaryotic cells both phylogenetically and morphogenetically the evolutionary relationship between prokaryotic and eukaryotic organizations is emphasized the difference of inferences from ribosomal rna and protein phylogenetic trees suggests a new possibility of synthesizing an evolutionary origin of eukaryotic cells as integrating morphogenetic contributions

this book is a comprehensive multi authored work on the structure and function of the mammalian testis the approach emphasizes gene expression translation and production of

specific gene products and the cellular and molecular regulation of these fundamental processes rather than provide a global survey of all aspects of male reproduction this book stresses specific mechanisms that underscore the structure and function of the testis it explains old and new concepts from a cellular and molecular perspective this novel approach allows the authors to forge links between cell and molecular biology and well established aspects of spermatogenesis and steroidogenesis the result is a well focused comprehensive and synthetic analysis of testicular biology
